

New York Opinion Index

Empire State Poll 2014

Report 1: Introduction & Methodology

Prepared by Sherry Xian, Ron Meyers, SRI

Introduction

This report outlines the methodology used for the annual Empire State Poll (ESP), a general survey of New York State residents who are at least 18 years of age that is conducted by the Survey Research Institute (SRI). Since it was founded in 1996, SRI has grown into a premier survey research facility and now comprises more than 60 staff and 22 Computer-Assisted Telephone Interviewing (CATI) stations.

The ESP 2014 marks the twelfth annual poll in an ongoing survey series that will probe residents' views on a range of workplace, social, political, and economic issues. The data derived from this yearly poll are of particular interest to academics, government officials, business and labor leaders and journalists. The data also help guide policy making, raise issues for civic dialogue, and suggest avenues of future research.

The ESP 2014 contains two sections: the "core" survey of topics that appear annually and a series of questions that are developed by third parties ("omnibus modules").

ESP Core Instrument

- The core survey instrument is a mix of questions about community, economic and government issues that reflect the specific research focus of Cornell faculty and the more general needs of policy makers.

ESP Omnibus Modules

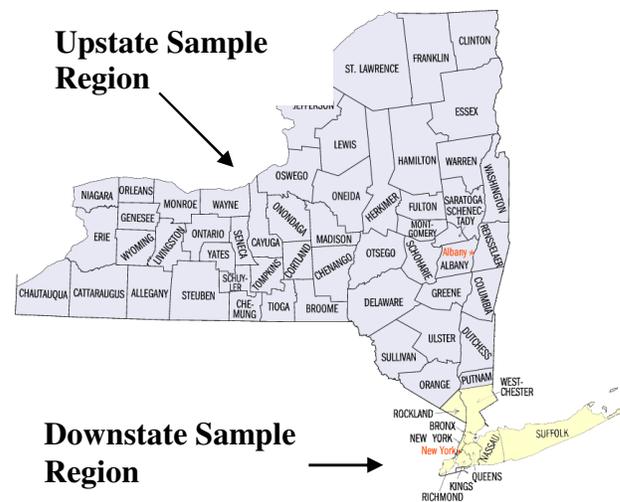

ESP is structured to allow for the inclusion of questions developed by Cornell University faculty and other researchers who are interested in surveying New York State residents on special topics. SRI charges a nominal fee for this service. The data collected from these "omnibus" modules are not reported in the general statewide poll results. For more information on the omnibus section of the poll, please contact SRI directly.

Sampling Methodology

The ESP 2014 sample consisted of randomly selected

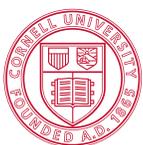

households generated by dual-frame random digit dial (dual-frame RDD) sampling of all telephone exchanges (landline and cell phone) within New York State and included both listed and unlisted households. Marketing Systems Group of Horsham, PA (a widely used full-service sampling company that provides samples to survey research organizations) supplied the sample, which excluded known business telephone numbers, disconnected numbers, and non-household numbers. The proportion of cell phone numbers generated for the sample was determined by a count of cell-only households in each county.

The state was divided into two regions, upstate and downstate, with sampling in proportion to the population totals. "Downstate" was defined as New York, Rockland, Kings, Richmond, Westchester, Suffolk, Queens, Nassau, and Bronx counties, with the remaining counties of the state defined as "upstate." Households from black and Hispanic neighborhoods were slightly over-sampled to ensure proper representation in the final sample of respondents.

Selection of individual respondents came in two steps: a household was randomly selected and then a household member who was at least 18 years old was randomly selected from within the household using the "most recent birthday" selection method.¹ An additional eligibility requirement was that all respondents had to be residents of New York State.

These selection procedures ensured that every household with a telephone had an equal chance of being included in the survey; and once a household was selected, each adult in the

household had an equal chance of being chosen.

ESP Data Collection

Telephone data collection began on January 18, 2014 and was completed March 2, 2014. Data collection for the ESP is concentrated in the same period every year, starting in January or February and ending in March or April. All interviews are conducted using a Computer-Assisted Telephone Interviewing (CATI) software system, with an average interview length of 25 minutes. A total of 800 interviews were completed – 400 upstate and 400 downstate. The survey was administered in both English and Spanish.

SRI survey interviewers are employed throughout the year. All interviewers undergo rigorous training by the SRI supervisory team and then complete four weeks of probationary interviewing and follow-up training. For each survey project, including ESP, interviewers are also given a survey-specific training session.

All interviewing staff are monitored and supervised at all times by an SRI supervisory team. SRI employs a computer-based proxy system that allows for audio and video monitoring of all interviewer stations. All supervisors regularly monitor interviewers to maintain data collection quality, provide immediate feedback, and troubleshoot issues as they arise.

SRI uses CASES (Computer-Assisted Survey Execution System) for CATI software. CASES is developed, distributed and supported by the Computer-Assisted Survey Methods (CSM) Program at the University of California, Berkeley and was commissioned by the U.S. Census Bureau. For more than 20 years, CASES has been one of the most widely used interviewing systems by survey centers in the United States. SRI employs programmers to support the CATI software and survey operations and to ensure data collection quality.

For ESP 2014, 800 respondents completed the survey out of a sample list of 6,806. Overall, the cooperation rate, often referred to as the response rate, was 65.7% and the American Association of Public Opinion Research definition of response rate was 21.3%. The cooperation and response rates differed between the upstate and downstate samples. The downstate sample was drawn from a sample list of 4,523, with a cooperation rate of 66.2% and a response rate of 17.0%. The upstate sample was drawn from a sample list of 2,706 and had a cooperation rate of 65.3% and a response rate of 28.4%.

These cooperation and response rates are consistent with those obtained by other research organizations such as the Pew Research Organization or CBS News, who regularly survey residents in New York State. Additional data are detailed in Table

1.

Table 1 Final Sample Status for ESP 2014

	Downstate	Upstate	Pooled
Completed Survey	400	400	800
Refusal	204	213	417
Active	1617	718	2335
Physical/Language Problem	105	26	131
Ineligible/Not a Household	114	117	231
<i>Total</i>	<i>2,440</i>	<i>1,474</i>	<i>3,914</i>
Response Rate ²	17.0%	28.4	21%
Cooperation Rate ²	66%	65%	66%

² American Association for Public Opinion Research (AAPOR) response rate and cooperation rate calculations. The response rate is the total number of survey completions divided by the total eligible sample (total sample minus all ineligible, non-households, and estimated proportion of households where eligibility was not determined). Cooperation rate is the total number of survey completions divided by the number of potential interviews (this includes all instances where contact was made with a properly selected person, but not including those instances where the respondent was incapable of cooperating due to language or physical limitations).

Sampling Error

The sampling error for ESP 2014 assumes the traditional 95% confidence level, which is equivalent to a "significance level" of .05. This means that for questions with approximately 800 respondents there is no more than a one in twenty chance that variations in the respondent sample will cause the ESP 2014 results to deviate by more than 3.5 percentage points when respondents are asked yes/no questions and an even distribution of responses is assumed (i.e., 50% say "yes" and 50% say "no"). Furthermore, the sampling frame was split between upstate and downstate residents, allowing comparisons between the overall state and these geographic regions with a one in twenty chance of sampling error greater than 4.9 percentage points for samples of approximately 400.

Sampling error is determined by the assumed distribution of responses and by the size of the sample. An extreme distribution of question responses has a smaller error range. If the distribution of responses were 80/20, for example, the sampling error would be 2.8% for the total sample of 800. See Table 2 for additional distributions and sampling error calculations. The size of the sample or subpopulation is also important because the margin of sampling error increases as the sample size decreases.

The margin of error from responses of demographically distinct subgroups within ESP 2014 will vary depending on the size of the group in question. Again, Table 2 provides some standard sampling errors for groups of different size.

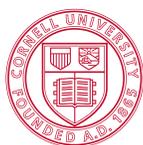

Table 2 Sampling Error Margins by Question Response Distribution and Sample Size³

Question Response Distribution (%)	Size of Sample (N)				
	800	600	400	200	100
50/50	3.5	4.0	4.9	6.9	9.8
60/40	3.4	3.9	7.8	6.8	9.6
70/30	3.2	3.7	4.5	6.4	9.0
80/20	2.8	3.2	3.9	5.5	7.8
90/10	2.1	2.4	2.9	4.2	5.9

³ Calculations made through the Survey System sample size calculator. <http://www.surveysystem.com/sscalc.htm>

Lastly, besides the possible sample error mentioned above, all public opinion polls may incur other sources of error associated with telephone data collection procedures, including the sampling error from the systematic exclusion of households without telephones, question wording, question order, and interviewer-induced bias.

Respondent Demographics

The accuracy of ESP 2014 can be evaluated by comparing selected characteristics of the survey respondents to data from the U.S. Census. A weight variable was developed based on geography (upstate versus downstate) in order to approximate actual population distribution within New York State. All substantive results described within any ESP 2014 report are weighted using this variable.

Table 3 compares the weighted distribution of ESP 2014 respondents' characteristics with the actual statewide distributions reported by the U.S. Census in the 2009-2011 American Community Survey 3-Year Estimates.

Table 3 Key Respondent Demographics for ESP 2014 (% reported)

Characteristics	Downstate (N=400)	Upstate (N=400)	Pooled ⁴ (N=800)	U.S. Census/ACS ⁵

Age				
18-24	11	9	11	13
25-34	13	11	12	18
35-44	19	13	17	18
45-54	18	25	20	19
55-64	21	20	21	15
65 and older	18	20	19	17
Gender				
Male	45	54	48	48
Female	56	46	52	52
Race				
White	55	92	69	66
Non-White	45	8	32	34
Ethnicity				
Hispanic (any race)	23	3	16	18
Non-Hispanic	77	97	84	82
Employment Status				
Employed	57	58	57	58
Unemployed	23	20	22	6
Not in labor force	20	22	21	36
Annual Household Income				
Less than \$10,000	3	1	2	8
\$10,000-49,999	38	35	37	37
\$50,000 -99,999	32	39	35	29
\$100,000 or more	27	25	26	26
Education (for ages 18+)				
Less than Bachelor's Degree	54	58	56	68
Bachelor's Degree or higher	46	42	44	33

⁴ Weighting applied to match actual distribution of upstate vs. downstate. Due to rounding, distributions may not add up to 100. Percentages are based upon calculations that exclude non-responses.
